

Microsoft Fabric Dashboard Report Pipeline

Located in the 'Updating Dashboard' folder, there are three files required for maintaining the dashboard visual. Listed in the order to run them:

1. Name: 1_powerquery_for_dashboard
 - a. Type: Dataflow Gen2
 - b. Use case: transform and clean data for the visuals in the dashboard created downstream
2. Name: 2_model_view_of_dashboard
 - a. Type: Semantic Model
 - b. Use case: create, edit, and manage relationships between tables. Impacts how the data will flow from table to table. This affects visuals, filters, dropdown menus/slicers.
3. Name: nccpss_dashboard_analytics
 - a. Type: Report
 - b. Use case: create visualizations using data from the database

How to Interact with the Files

Step 1: Open the '1_powerquery_for_dashboard' file

Locate the upper menu, to refresh the data tables, select 'Query' and then click 'Refresh'.

The transform tab has all the features needed to transform the data, such as pivoting/unpivoting, splitting columns, replacing values, etc.

To load changes made in this file, click on 'Save & run' on the far left of the upper menu.

Warning: Be sure the table view has a designated **Data destination** that links back to your lakehouse, and that your Power Query columns are correctly mapped to the lakehouse columns.

Step 2: Open the '2_model_view_of_dashboard file

The tables are structured in a way that allows the dashboard to filter all visuals by Certification Status (e.g., Current, Lapsed, Pending, etc.). If another table is added that needs to be filtered by Certification Status, be sure its relationship to the `gold_certification_status_dim` matches the other tables'.

Editing relationships amongst tables can be done by selecting 'Manage Relationships', then either selecting the 'New Relationship' button in the top left to create a new relationship or changing an existing relationship by clicking the three dots ('...') on a given relationship and clicking 'Edit'.

To add or remove a table in the semantic model, click on 'Edit Tables' in the upper menu. From here, you can select the tables you'd like to include in the dashboard report or deselect the tables you no longer need.

To add a filter to the dashboard report (like the county of employment and county of residence dropdown menu), you will need to create a parameter table in the semantic model view. Click on 'New Parameter', then select whether you'd like the filter to be based on a field/column or a value.

When changes are made and ready to be pushed to the dashboard view, click the “Refresh” button.

Step 3: Open the ‘nccpss_dashboard_analytics’ file

Locate the refresh icon in the far right of the upper menu to load changes from the previous two steps.

From here, select ‘Edit’ to add or make changes to the visuals or to filter the data.

To add a dropdown menu to a visual (also known as a slicer), select the slicer icon from the Visualizations menu on the right side of the screen. Then drag the parameter table from the Data menu further to the right. This will create a menu that you can customize to your liking (i.e. size of font, single-select/multi-select, etc.)

To export the dashboard, stay in ‘Edit’ view and click on the ‘File’ dropdown menu. This menu allows you to select how you’d like to export the report. To display as a dynamic, interactive

dashboard on a website, it is recommended to export the dashboard report as an **embedding for a website or portal**.
