

Incremental Pipeline User Guide

Overview

This guide explains how to update the system with new data. The incremental pipeline only processes new or updated records, making updates faster and more efficient.

IMPORTANT: File Naming Requirement

Every time you upload a new data file, it **MUST** be named exactly:

nccpss_data.csv

Using a different file name may cause the system to fail or not detect updates correctly.

Step-by-Step: Adding New Data

- 1 Export the latest data from Drupal as a CSV file.
- 2 Open the file and add or update records if needed.
- 3 Save the file with the exact name: **nccpss_data.csv**.
- 4 Upload the file into the Bronze (raw data) folder in Microsoft Fabric, replacing the existing file. *(Do not upload multiple files — always replace the existing one.)*
- 5 Run the 'drupal_delta_detect' notebook.
- 6 Run the 'silver_incremental_match' notebook.
- 7 Run the 'gold_incremental_build' notebook.

What Each Notebook Does

- 1 drupal_delta_detect: Identifies which records are new or have changed.
- 2 silver_incremental_match: Cleans the data and matches records to existing individuals.
- 3 gold_incremental_build: Updates the final tables and dashboard with the new information.

Best Practices

- 1 Only add or modify a small number of rows at a time.
- 2 Keep formatting consistent (dates, text, etc.).
- 3 Always replace the file, do not upload multiple versions.
- 4 Ensure required fields like email and name are filled correctly.

Why This Matters

- 1 The system runs faster by only processing changed data.
- 2 No need to rebuild the entire dataset.
- 3 The dashboard stays up to date efficiently.
